

INTRODUCTION TO CSPA MODULES

Romain Tailhurat (INSEE)

Trygve Falch (SSB)

"TIMELINE-OVERVIEW"

CSPA CHALLENGES TODAY

- Re-usability of services is difficult in its current state
- Different NSI's have different investments in different technology platforms
- CSPA lacks good guidance for how services should be implemented and made shareable.

FRICTION POINTS

- “My data layer is Postgre not MySQL”
- “I’m using an event broker, i can’t use your REST endpoint”
- “I don’t have an ESB!”

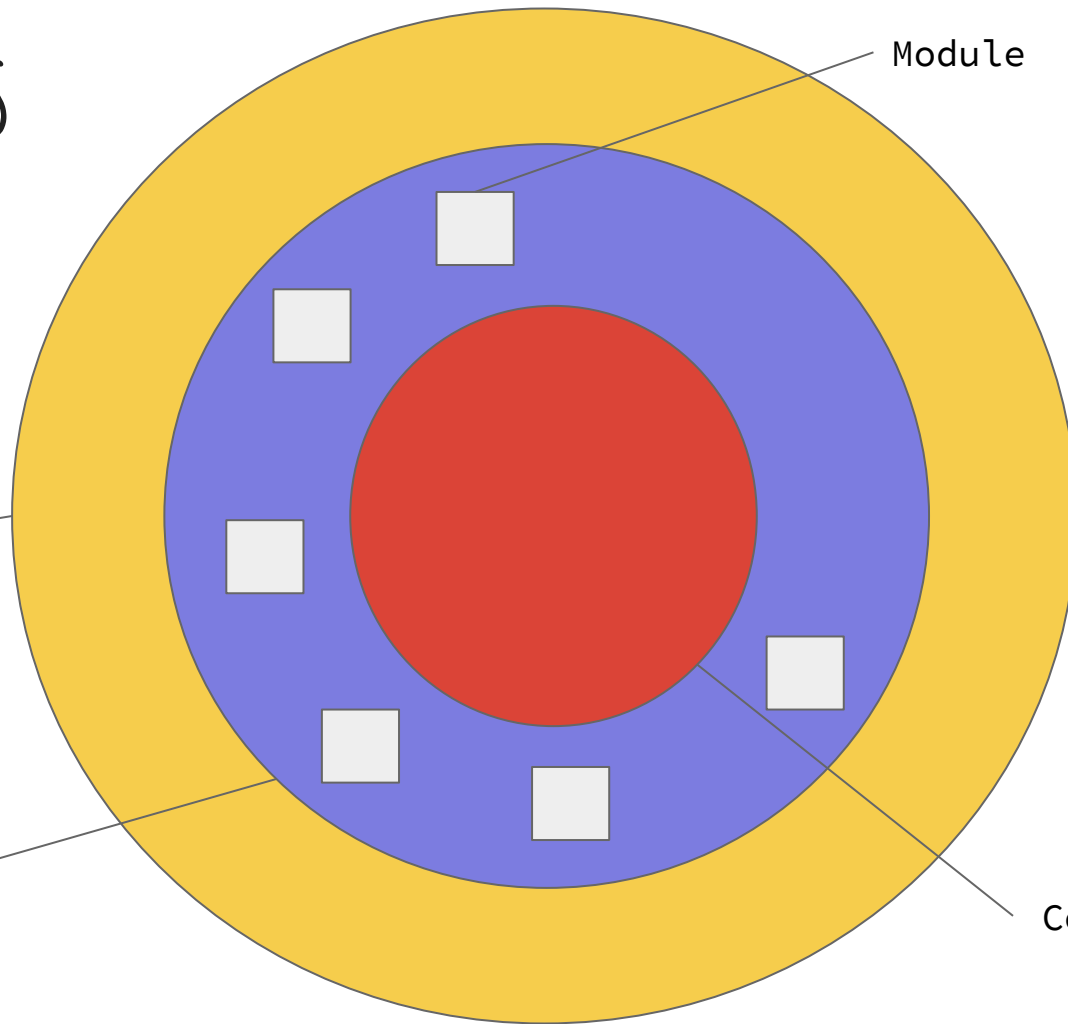

- Many other friction points related to information architecture, etc.

⇒ CSPA Modules to the rescue!

CSPA MODULES

- A CSPA Module is a small piece of functionality that communicates with the core business-logic of the service, and with the outside world
- Modules are optional for a CSPA service, but it will make sharing easier if you decide to use it
- A module will be the technical “glue” for binding the CSPA Service to a local NSI’s environment while still retaining the core business logic of the Service

DIFFERENT LAYERS THAT AFFECT SHARING

Packaging and
distribution

CSPA Service
w/modules

Core Logic

SHAREABILITY SCALE

Not modular

Fully modular

“I get an immediate benefit from this service even if i should adapt my process to the **communication module**”

“I can change the **data adapter module** of this service by developing my own version but i still get the **core logic**”
