

FEASIBILITY STUDY OF SATELLITE IMAGERY ANALYSIS FOR WEALTH INDEX DEVELOPMENT IN INDONESIA

Arie Wahyu Wijayanto

OUTLINE

MOTIVATION

METHODOLOGY

PRELIMINARY RESULTS

CONCLUDING REMARKS

MOTIVATION

- Eliminating poverty is Indonesia's main target for sustainable development by 2030
- Establishing a complete poverty database at **national scale** is costly
 - Currently available data: PSE 2005, PPLS 2008, PPLS 2011, PBDT 2015
- Poverty data estimation through biannual Households Socio-Economic Surveys (SUSENAS) are only available up to the **district level**

MOTIVATION

- Estimation of regional poverty using satellite imagery is a new alternative to support poverty alleviation (Chen & Nordhaus, 2011; Henderson et al., 2012; Ivan et al., 2020).
- We aim to evaluate the feasibility of estimating the **poverty spatial distribution** and **wealth index development** using satellite imagery and geospatial data to enhance the **cost effectiveness**, **granularity**, and **accuracy** of poverty statistics.

Estimating Poverty
Spatial Distribution

DATA

Data

Day time
satellite images

Landsat 8
Sentinel 2

Night time light
intensities

NPP-VIIRS

National Polar-orbiting
Partnership–Visible Infrared
Imaging Radiometer Suite

Poverty
Database

PBDT 2015

Indonesia Integrated Poverty
Database

METHODOLOGY

Input image

Day time satellite images

Night time light intensities

Extract features using trained machine learning algorithm

Convolutional Neural Networks (ResNet34)

Extracted features

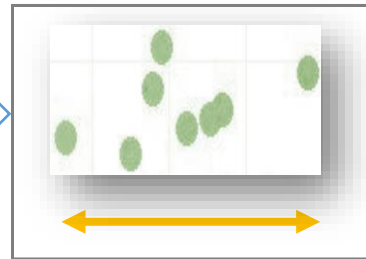

Trained regression model

Ridge Regression
Support Vector Regression

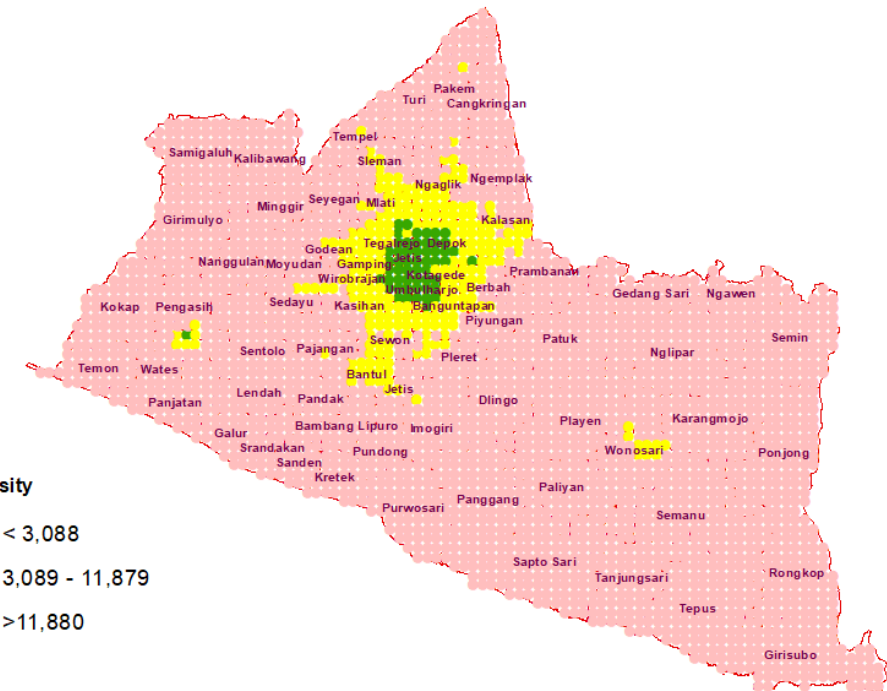

Poverty statistics indicators

PRELIMINARY RESULTS: YOGYAKARTA PROVINCE

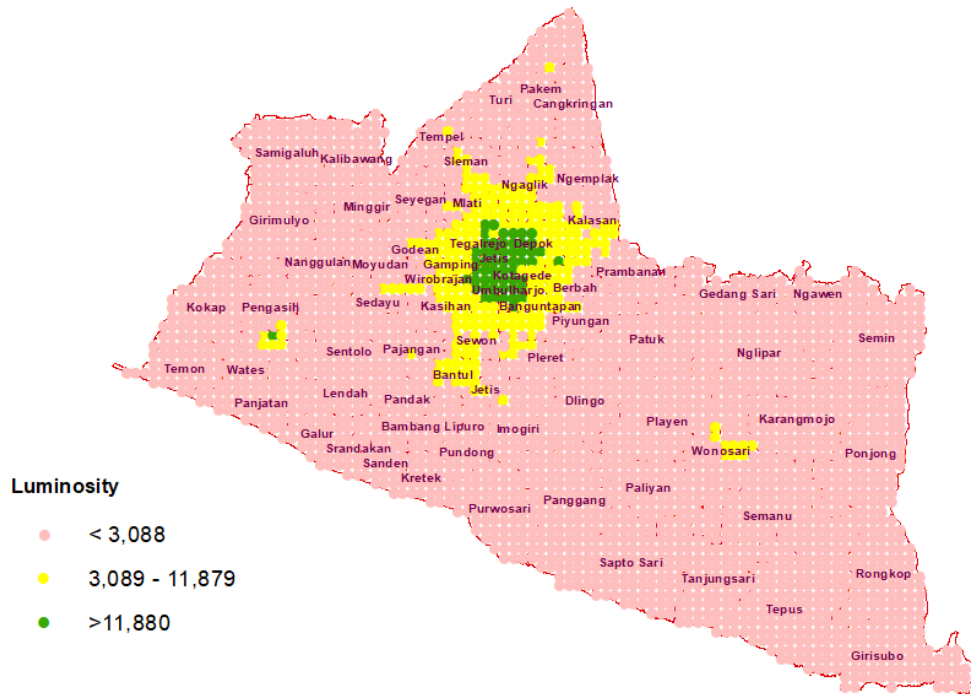

Night-Time Lights Luminosity

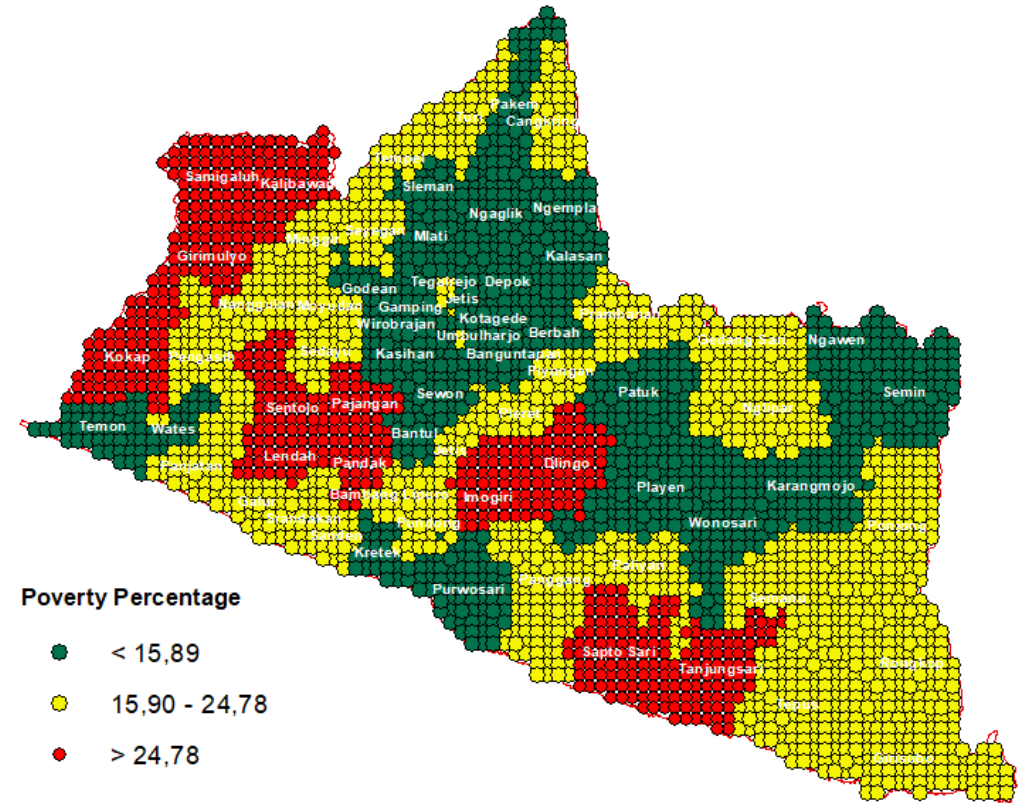

The center of Yogyakarta City has a greater luminosity intensity than rural areas and areas outside the city.

PRELIMINARY RESULTS: YOGYAKARTA PROVINCE

Night-Time Lights Luminosity

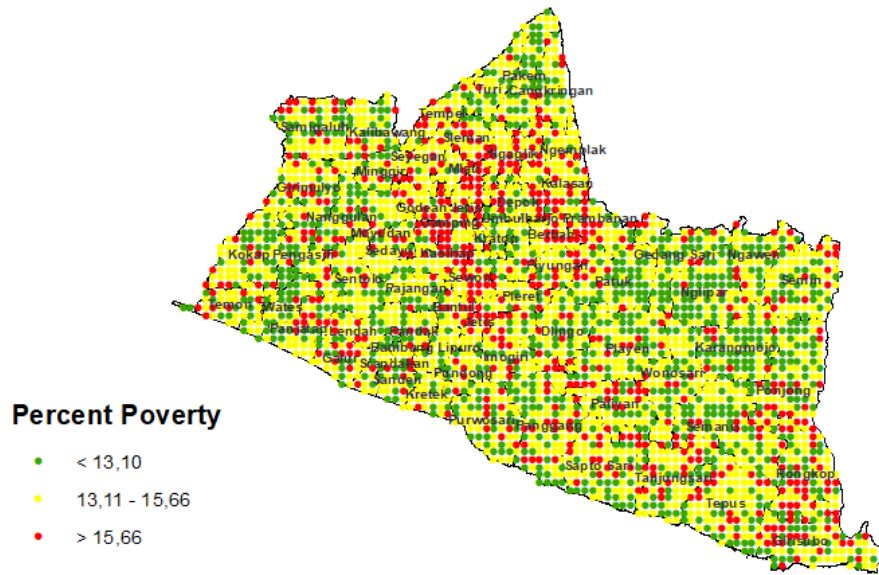

Official Poverty Distribution (PBDT 2015)

The city center of Yogyakarta province has a greater intensity of night-time light and a lower poverty rate than other areas.

RESULTS: PREDICTED POVERTY DISTRIBUTION (DAY TIME - NIGHT TIME LIGHT DERIVED ESTIMATION)

Poverty Percentage by prediction model with RES34

CNN Model Testing and Evaluation

Confusion matrix

	0	1	2	3
0	88	37	26	1
1	44	44	8	2
2	7	11	23	11
3	0	0	6	19
	0	1	2	3

Actual

Predicted

DIY 2015 Ridge Regression
Validation set: poverty share (%)

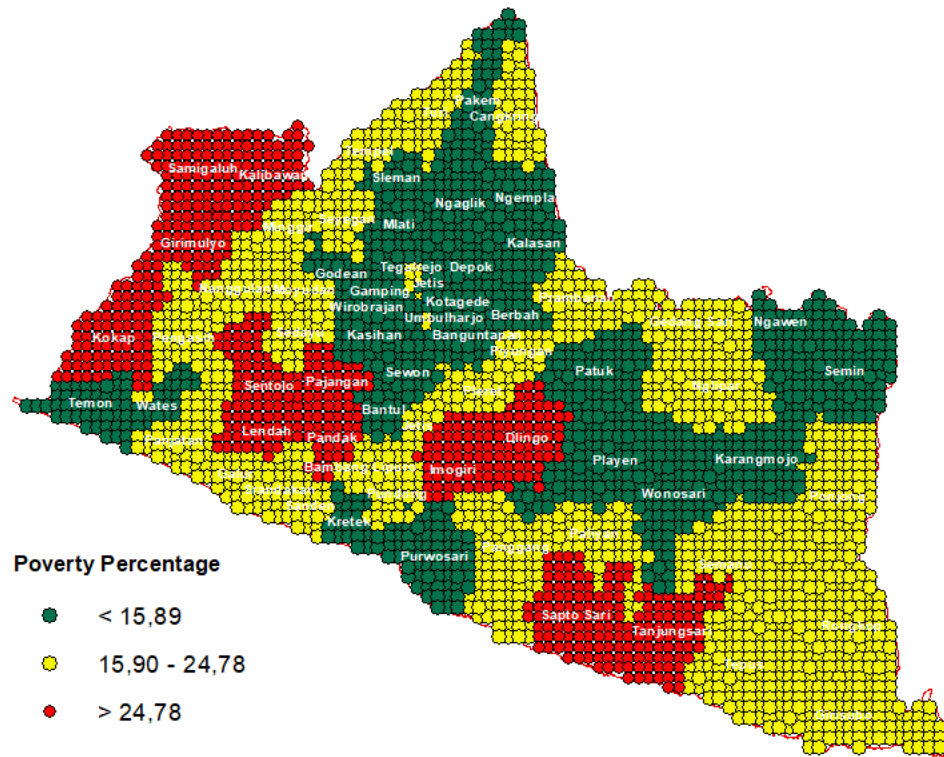

RMSE_valid 0.0896
 RMSE_full 0.0861
 R2_valid -0.5537
 R2_full -0.4796
 R2_train 0.9247

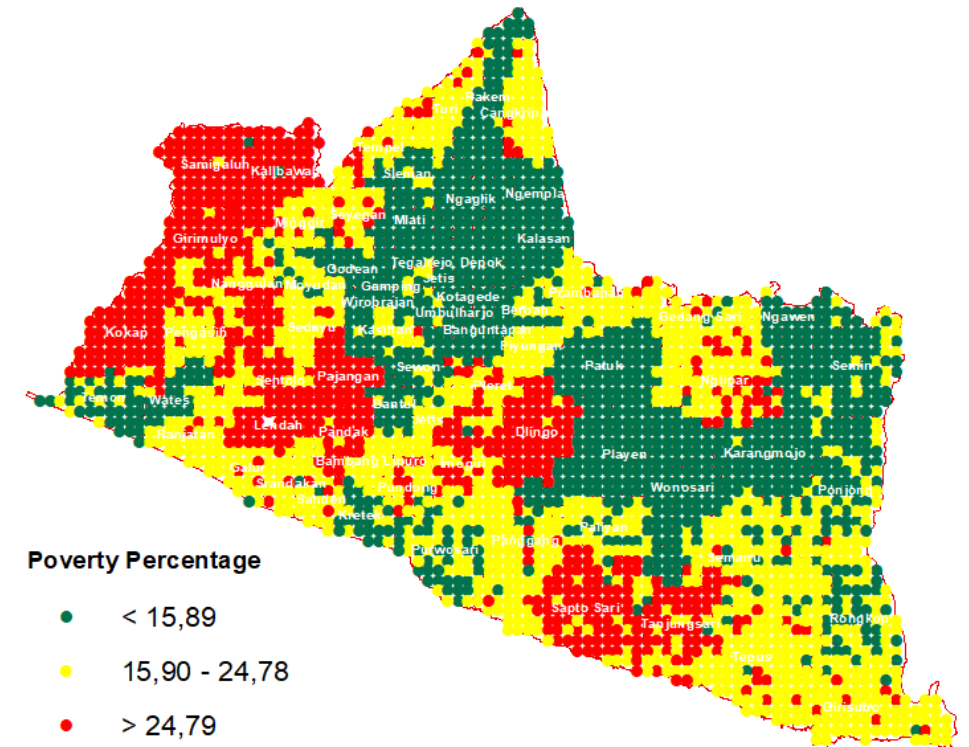

The resulted model predictions when compared with the Official Poverty Distribution (PBDT 2015)

RESULTS: PREDICTED POVERTY DISTRIBUTION (DAY TIME - NIGHT TIME LIGHT DERIVED ESTIMATION)

Distribution poverty percentage by PBDT 2015

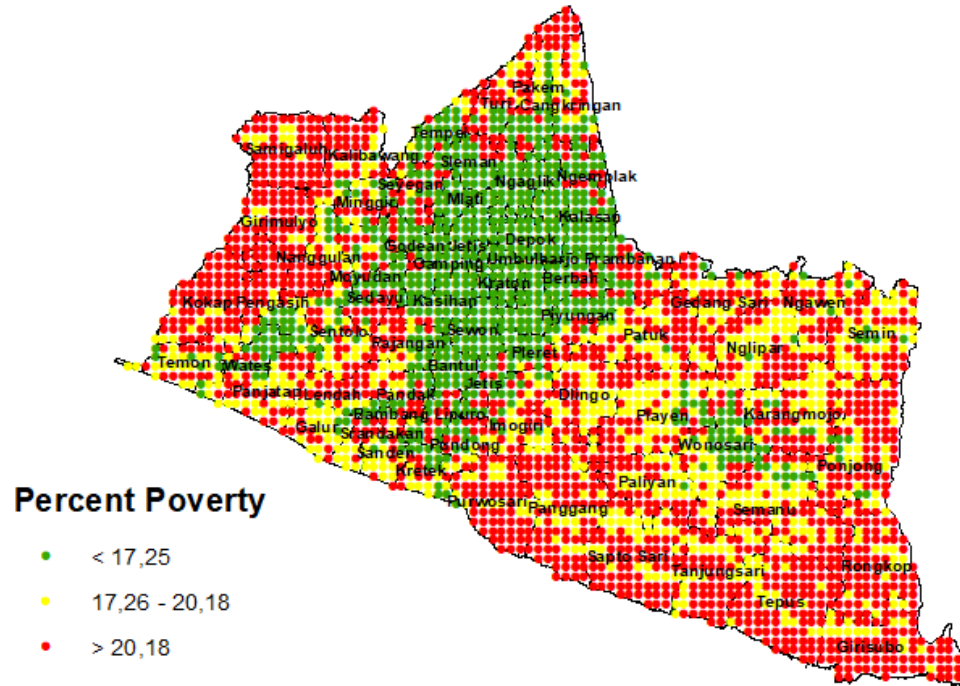

Poverty Percentage by prediction model with RES34 after it is rescaled by population grid

The results of the model predictions after rescaling are quite good in estimating regional poverty with an RMSE value of 8 percent

RESULTS: PREDICTED POVERTY DISTRIBUTION (NIGHT TIME LIGHT DERIVED ESTIMATION)

Using log transformation for transformation luminosity intensity to normal value distribution

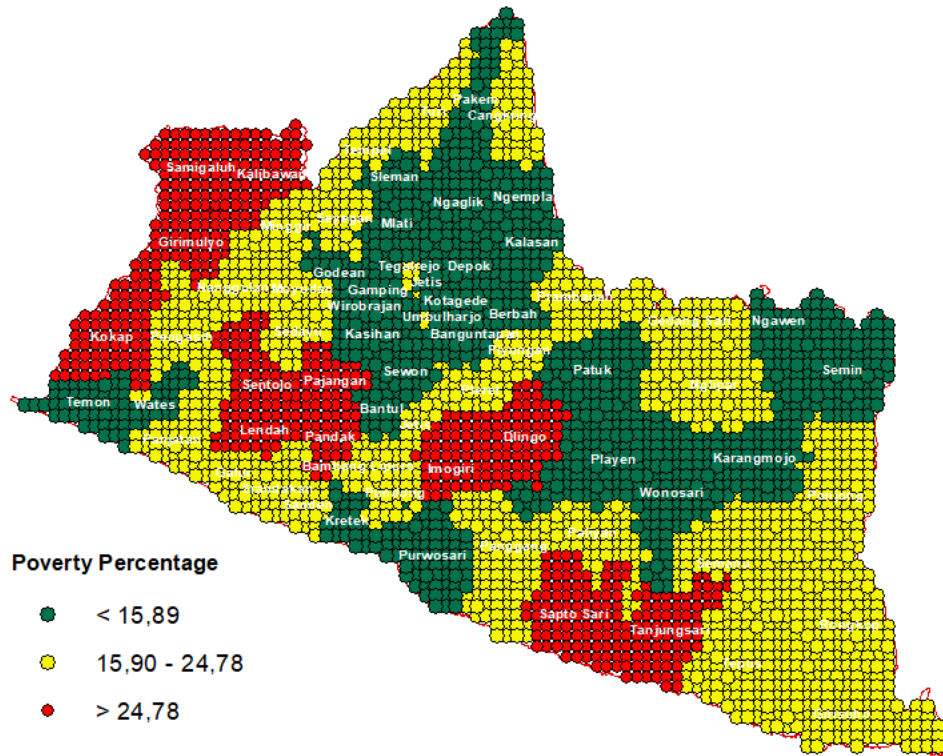

Using Support Vector Regression

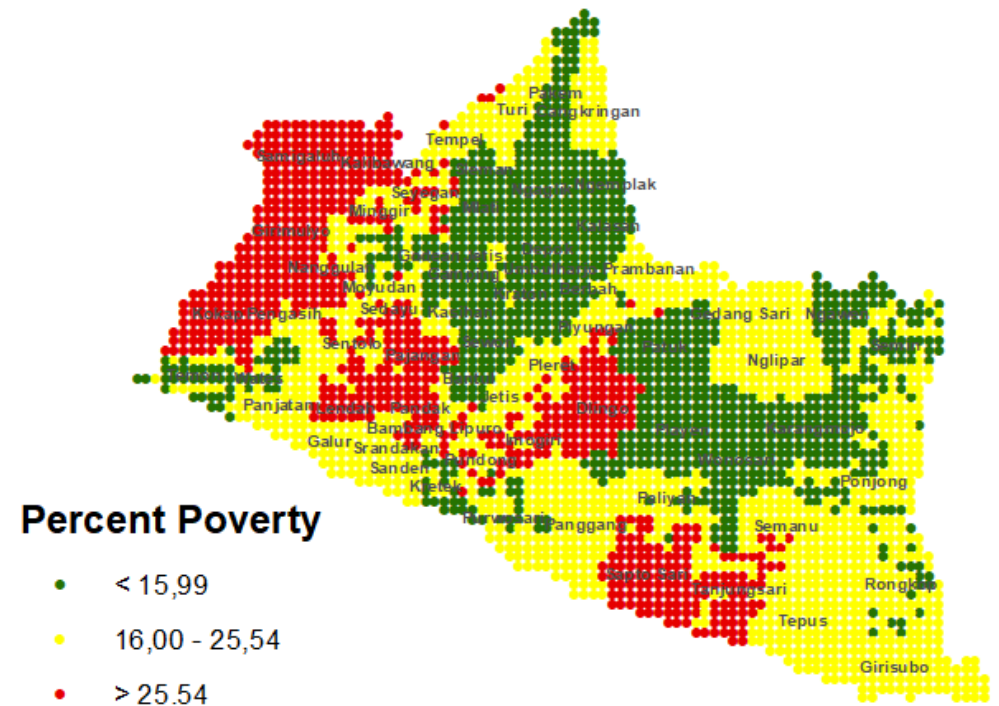

The results of the model predictions with only NTL Imagery are better than use day light imagery.

RESULTS: PREDICTED POVERTY DISTRIBUTION (NIGHT TIME LIGHT DERIVED ESTIMATION)

Official Poverty Distribution (PBDT 2015)

Poverty Percentage by prediction model with SVR after it is rescaled by population grid

Using NTL Imagery, we can predict regional poverty distribution more properly. After rescaling using the population grid, we better spatial distribution poverty compared with the Official Poverty Database (PBDT 2015).

CONCLUDING REMARKS

KEY FINDINGS:

- The model has been able to predict poverty relatively well.
- Using only night time light derived data for prediction is better than its combination with raw day time imagery.
- Ground checks need to be done to ensure that the night light data represents the economic activities in some area.

ON GOING WORKS:

- Investigating the use of additional geospatial features in accordance with relevant studies:
 - Urban Heat Island (Buyantuyev, 2009 and Dissanayake, 2018)
 - Air Pollution from CO Emissions (Tariq, 2017)
 - Built-up Area Distribution (Faisal, 2016)
- Incorporating small area estimation

THANK YOU
