

Leveraging AI-assistants for better metadata and communication

Bilyana Bogdanova, Olivier Sirello, Krzysztof Zdanowicz - Bank for International Settlements

Generative AI project - High-Level Group for the Modernisation of Official Statistics

Virtual, 29th April 2024

Outline

- Introduction
- Solution
- Results
- Requirements, challenges and risks

This presentation is based on UNECE (2023), [Large Language Models for Official Statistics](#), High-Level Group for the Modernisation of Official Statistics.

At one glance

- **What**
 - Editing and checking time series metadata
- **Why**
 - Time- and resource- intensive
 - Use of knowledge retrieval is required
- **How**
 - OpenAI Assistants
 - End-to-end workflow (SDMX to SDMX)

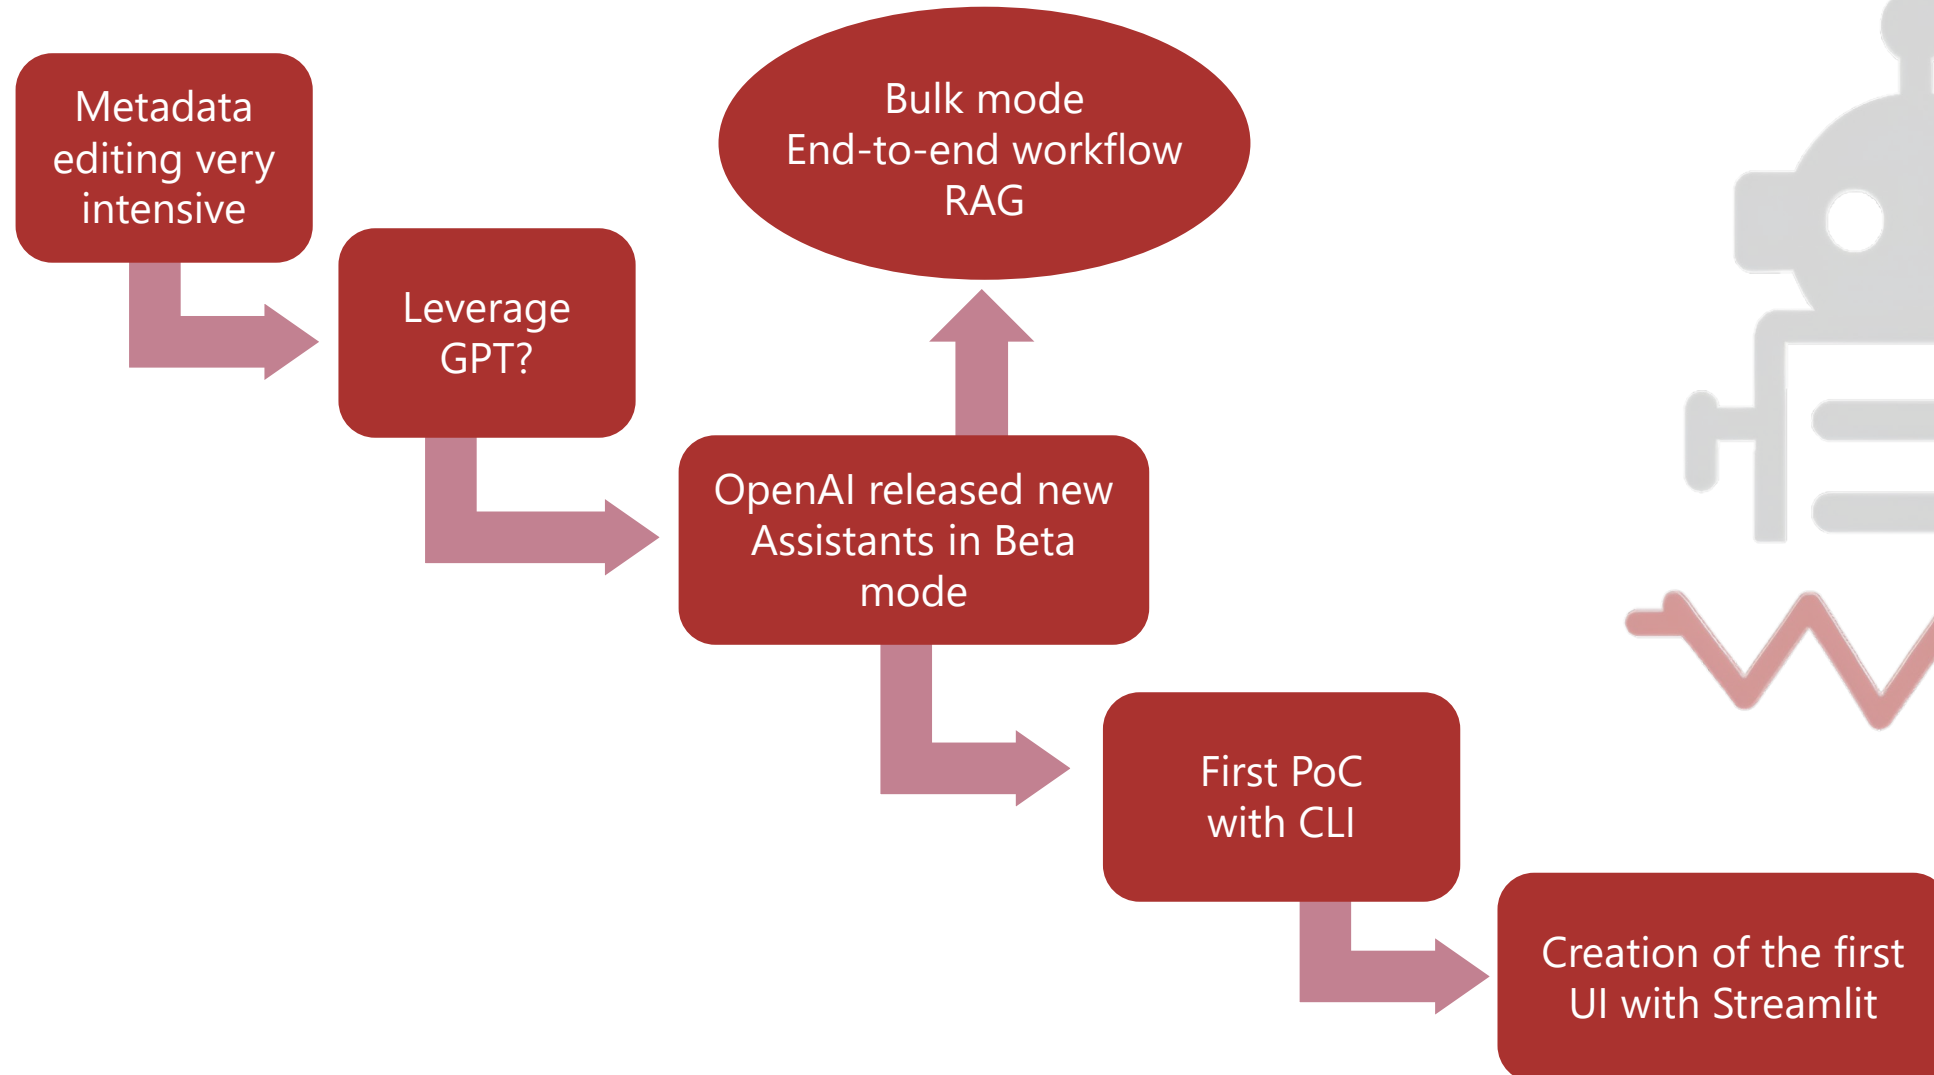

Generic Statistical Business Process Model

Quality Management / Metadata Management							
Specify Needs	Design	Build	Collect	Process	Analyse	Disseminate	Evaluate
1.1 Identify needs	2.1 Design outputs	3.1 Build collection instrument	4.1 Create frame & select sample	5.1 Integrate data	6.1 Prepare draft outputs	7.1 Update output systems	8.1 Gather evaluation inputs
1.2 Consult & confirm needs	2.2 Design variable descriptions	3.2 Build or enhance process components	4.2 Set up collection	5.2 Classify & code	6.2 Validate outputs	7.2 Produce dissemination products	8.2 Conduct evaluation
1.3 Establish output objectives	2.3 Design collection	3.3 Build or enhance dissemination components	4.3 Run collection	5.3 Review & validate	6.3 Interpret & explain outputs	7.3 Manage release of dissemination products	8.3 Agree an action plan
1.4 Identify concepts	2.4 Design frame & sample	3.4 Configure workflows	4.4 Finalise collection	5.4 Edit & impute	6.4 Apply disclosure control	7.4 Promote dissemination products	
1.5 Check data availability	2.5 Design processing & analysis	3.5 Test production system		5.5 Derive new variables & units	6.5 Finalise outputs	7.5 Manage user support	
1.6 Prepare business case	2.6 Design production systems & workflow	3.6 Test statistical business process		5.6 Calculate weights			
		3.7 Finalise production system		5.7 Calculate aggregates			
				5.8 Finalise data files			

- Process
- Analyse
- Disseminate

The development journey: a bottom-up approach

Key principles

- **Agility, modularity and outsourcing**
 - Avoid “reinventing the wheel”
 - Leverage existing **AI-powered assistant**
 - **Generalize use cases and customize**
- **Low costs, high customization**
 - **Low implementation** and deployment costs
 - **Ease of use** for the final users
 - High **accessibility** and shallow learning curve
 - Easily accessible by anyone (eg business user) with an OpenAI account within the organisation
- An **end-to-end solution leveraging SDMX**
 - SDMX 2.1 ML file as input and output
 - Reading and parsing done through sdmxthon

The BIS Data Portal

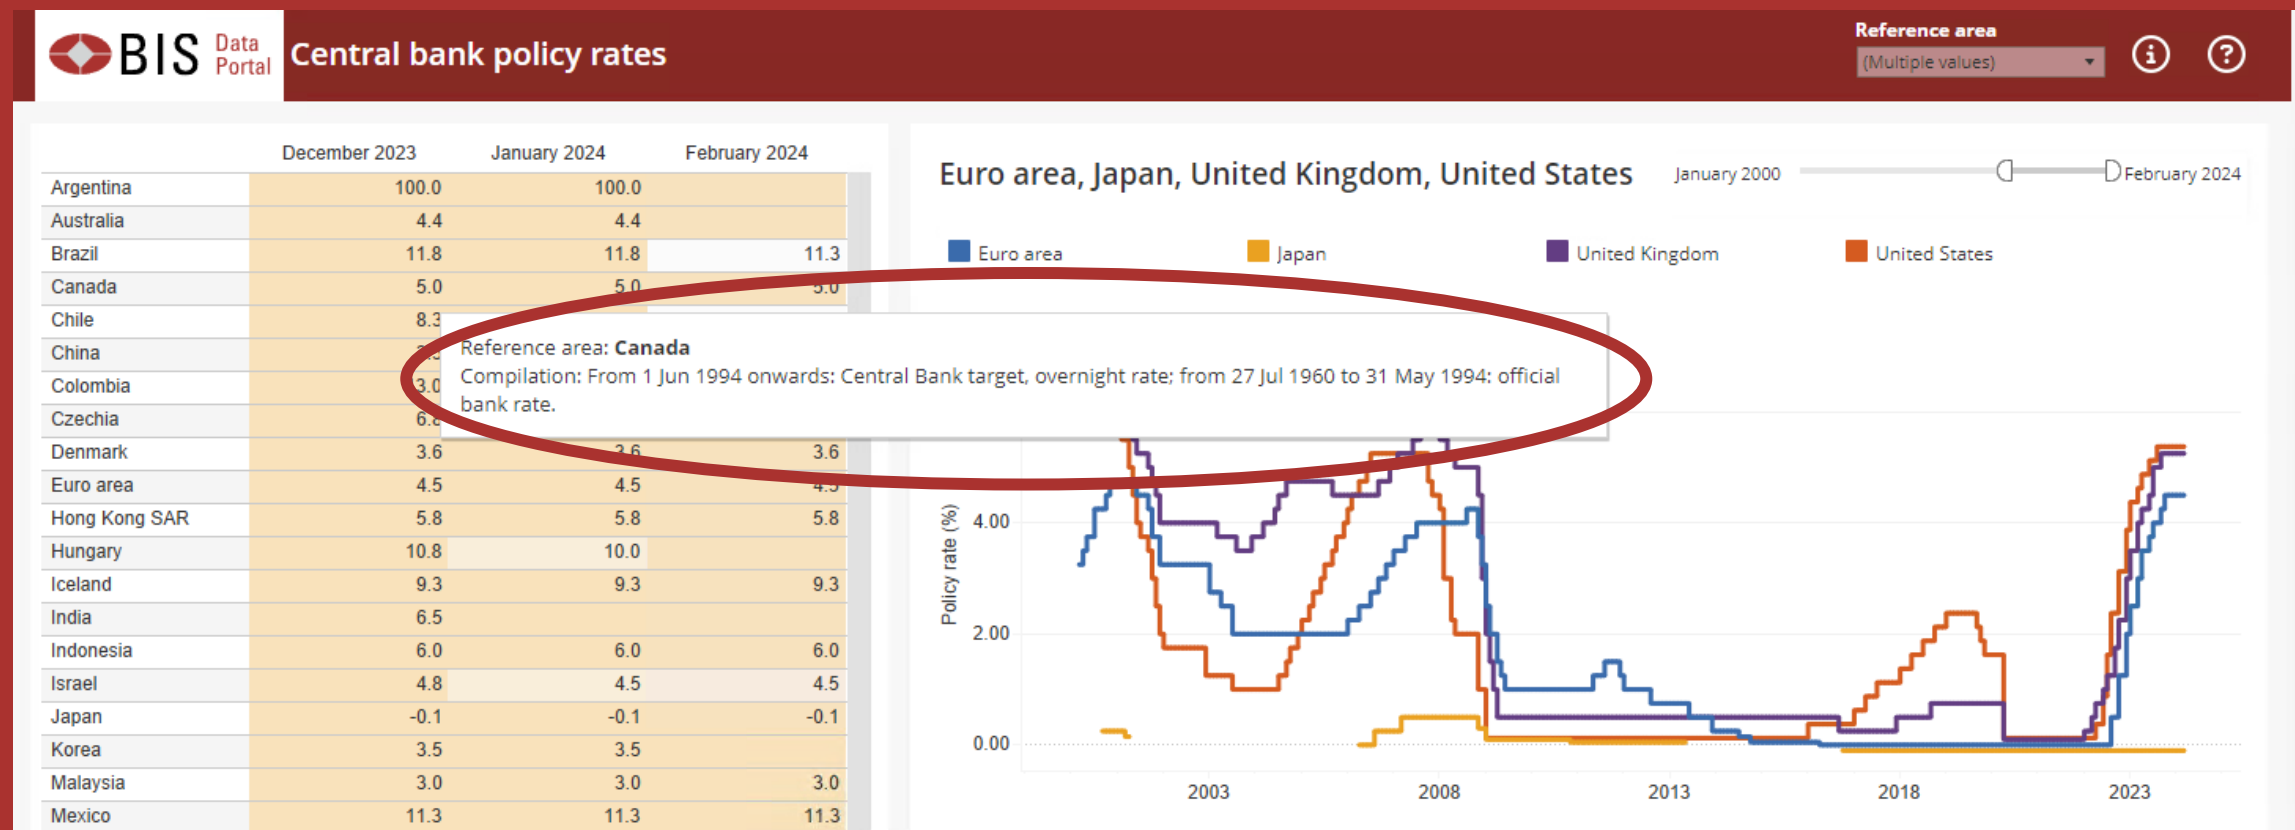

BIS statistics: why a new dissemination tool?

The BIS Data Portal and metadata

Dashboards

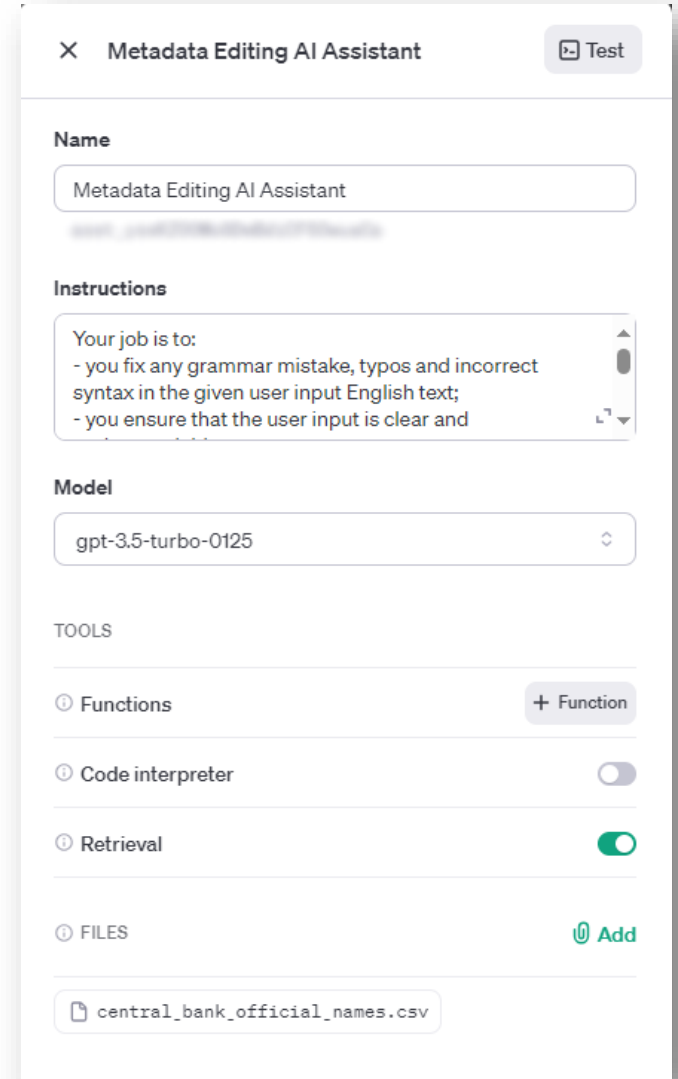

Solution

AI Metadata Editor – OpenAI Assistants

- A custom program for **metadata formatting** and **editing**
- Users may quickly:
 - Create their own assistant (eg ID)
 - Define the set of instructions
 - Select the appropriate model
 - Add other useful functions

The screenshot shows the 'Metadata Editing AI Assistant' configuration page. It includes a 'Name' field with the value 'Metadata Editing AI Assistant', an 'Instructions' text area containing the text: 'Your job is to: - you fix any grammar mistake, typos and incorrect syntax in the given user input English text; - you ensure that the user input is clear and', a 'Model' dropdown menu set to 'gpt-3.5-turbo-0125', and a 'TOOLS' section with three items: 'Functions' (with a '+ Function' button), 'Code interpreter' (with a toggle switch), and 'Retrieval' (with a toggle switch). At the bottom, there is a 'FILES' section with an 'Add' button and a file named 'central_bank_official_names.csv'.

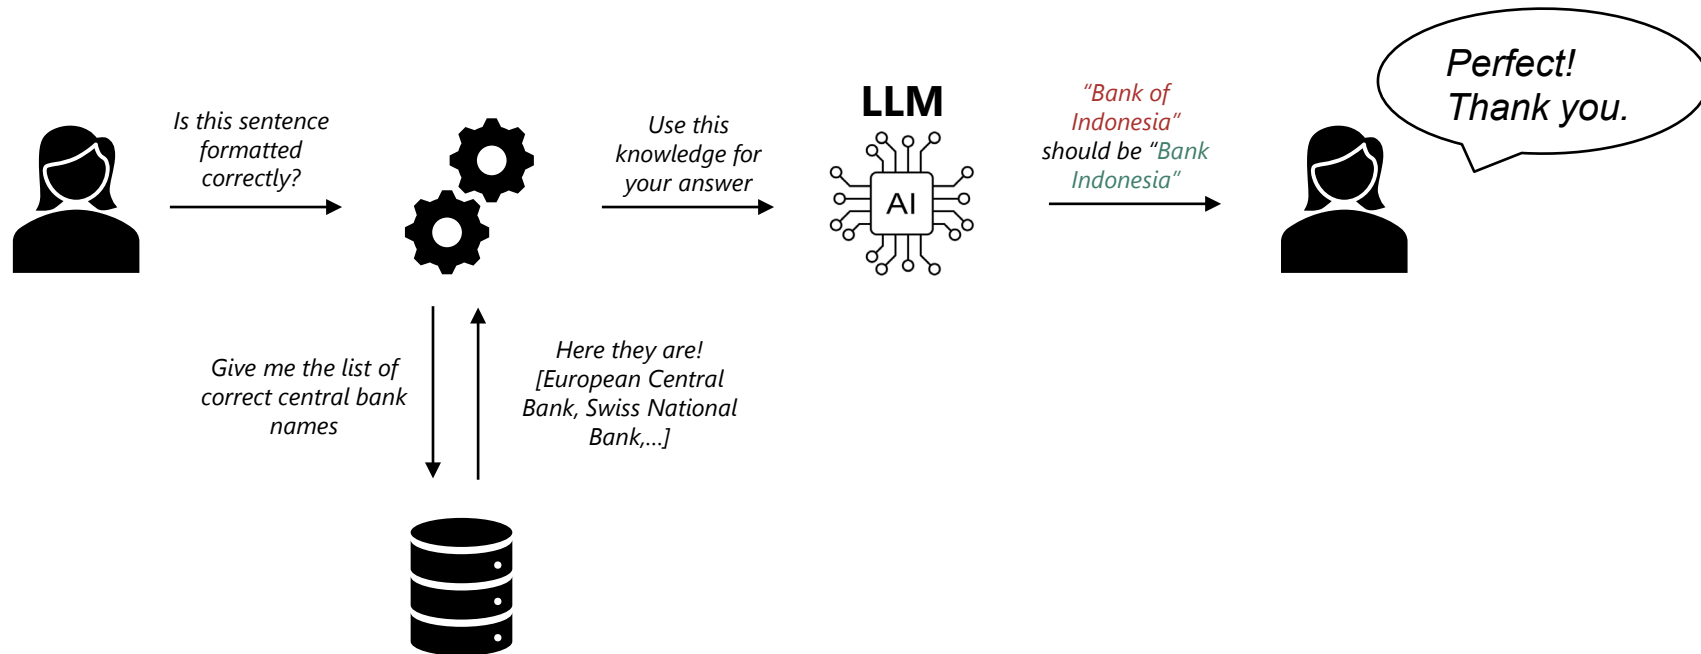

What is an assistant?

- Custom AI that uses OpenAI's models and tools
- Can call the models with specific instructions
- Can use different tools in parallel:
 - Code writing – Assistant writes and runs Python code
 - Function calling – getting structured output from the model (eg JSON)
 - **Knowledge retrieval** - augments the Assistant with custom knowledge
- Can access/create files in several formats

Knowledge retrieval

- OpenAI's version of Retrieval-Augmented Generation (RAG)
 - Enables the LLM to form answers based on a custom knowledge base

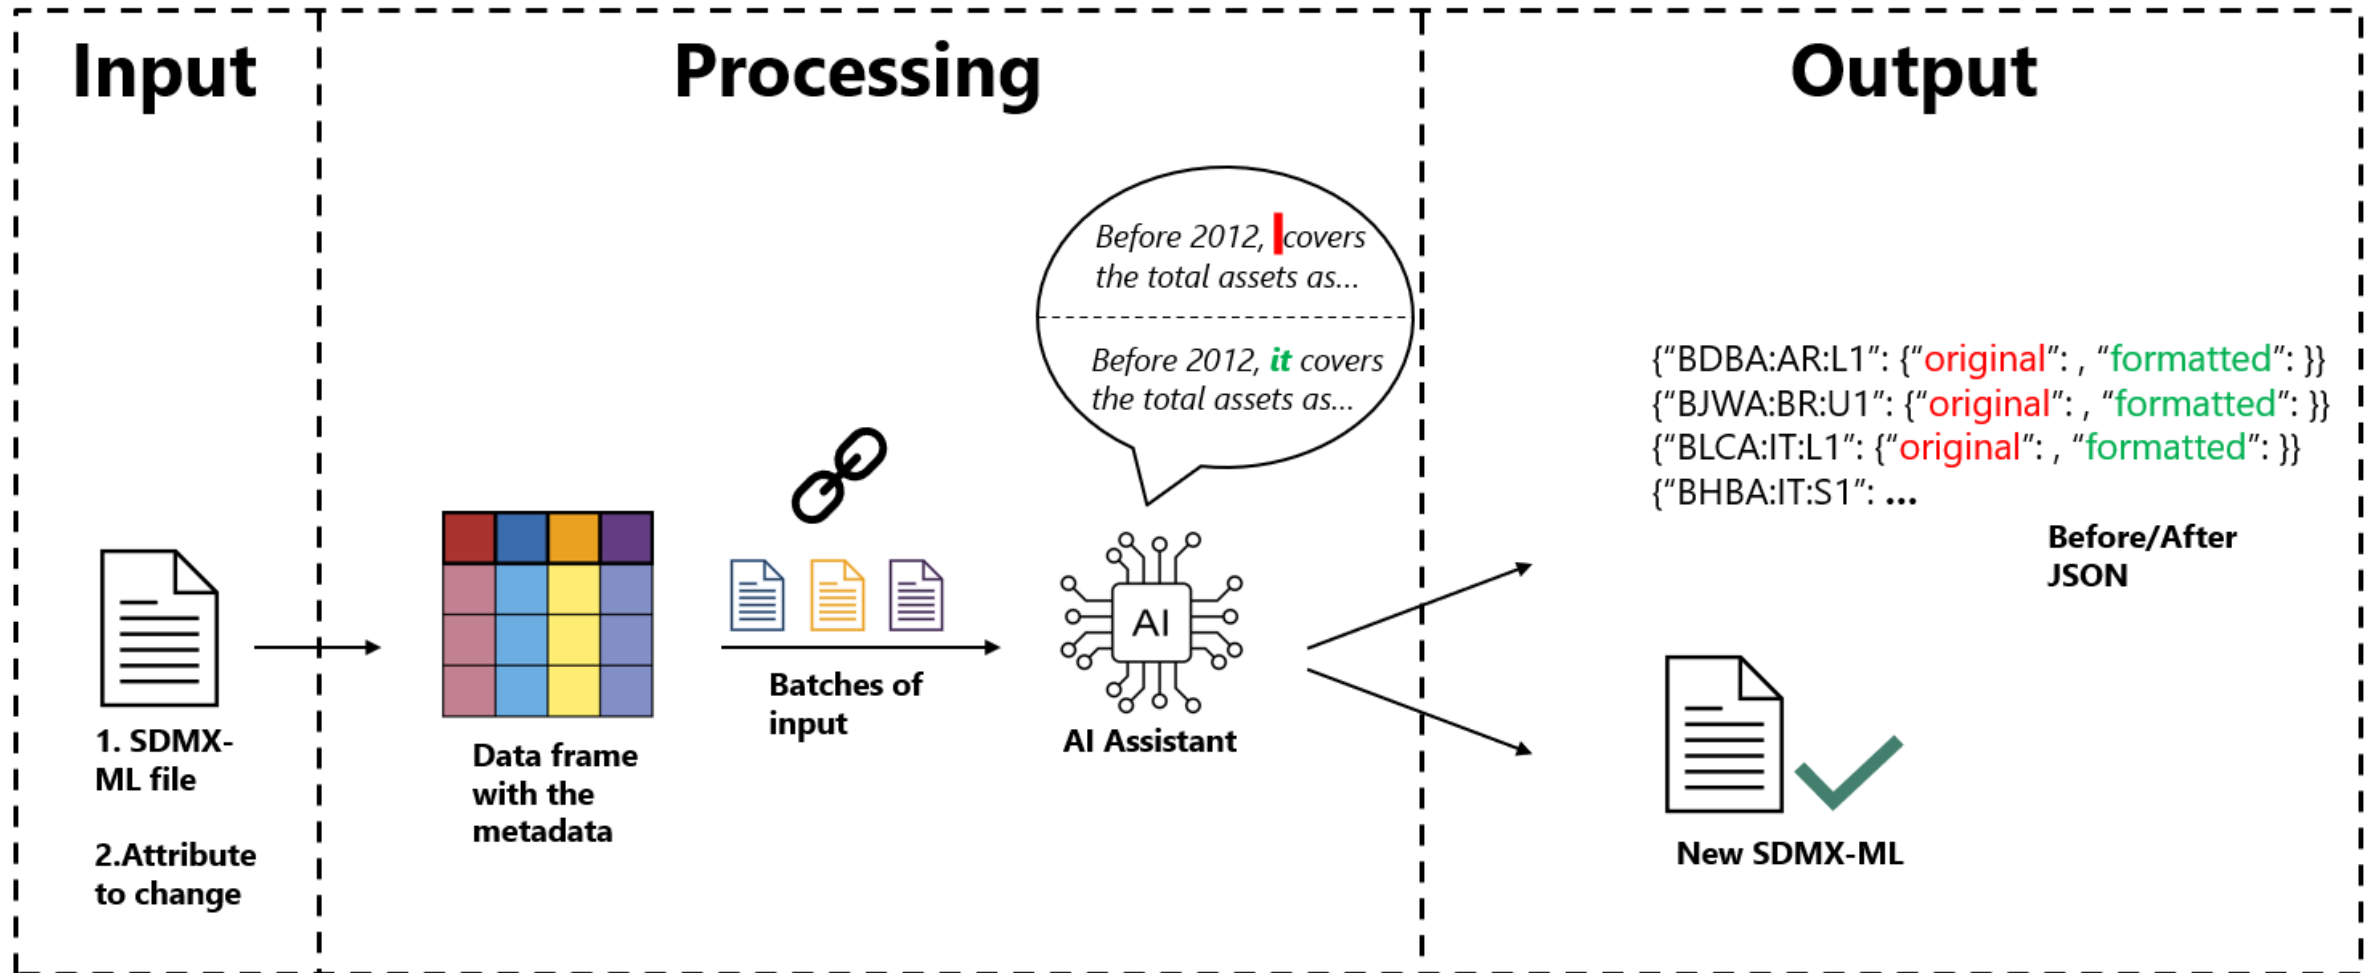

- Only available since Nov 2023 – still beta version

Instructions for the Assistant

- Level of detail depends on the goal:
 - 1) Generic instructions
 - *Fix grammar mistakes, typos and incorrect syntax in the given user input*
 - 2) More “specific” requirements
 - *Abbreviate months (eg January shall be Jan) except when the month is at the end of the sentence*
 - 3) BIS specific rules
 - *Names of central banks, e.g. Magyar Nemzeti Bank and not Hungarian National Bank*
- *More ≠ better (prompt engineering)*

Requirements, challenges and risks

Requirements, challenges and risks

- Restricted to **public** information
- **Low reproducibility** but business case is mostly **one-off**
- Dependency on an external service
- Performance vs accuracy trade-offs
- Human-in-the-loop!
 - The only safe way of onboarding LLMs in their current form
 - Version control is key

Summary: advantages and disadvantages

- + **Low** development **cost**
- + **High modularity**
- + High **accuracy** (although not perfect)
- + **Automates** manual, time-consuming task

- Not fully **reproducible**
- **IT infrastructure** dependent
- (Requires **human supervision**)

Thank you!
