This phase builds the production solution to the point where it is ready for testing and review. The outputs of the "DESIGN" phase direct the selection of reusable processes, instruments, information, and services that are assembled and configured in this phase to create the complete operational environment to run the process.

This phase is broken down into the following sub-processes:

- Choose Registries (Pilot & Production)
- Create SDMX Artefacts in Pilot Registry
- Implementation & Usage Guidelines
- Create Pilot Review Material
- Internal Technical Testing
