5.6 Calculate weights

This sub-process creates weights for unit data records according to the methodology developed in sub-process 2.5 (Design, processing and analysis). For example, weights can be used to 'grow-up' data to make them representative of the target population (e.g. for sample surveys or extracts of scanner data), or to adjust for non-response in total enumerations. In other situations, variables may need weighting for normalisation purposes. It may also include weight correction for benchmarking indicators (e.g. known population totals).

Quality Indicator:
- The weights are adjusted for coverage and non-response error (kistone indicator).
For details, see Quality Indicators for OSFM (version 2.0).
