Issue #50: Statistical Classifications and Code Lists

The right hand side of the GSIM Concepts group is relatively detailed compared to the rest of the Concepts figure. What about discussing the possibility of removing some of the details related to Node Sets (Node Set itself(?), Code, Code Value, Designation, Category or Category Item) and moving them into CSPA LIM (some are already in GSIM Statistical Classification Model)?

The relationship between Statistical Classifications and Code Lists is a bit problematic and could be further discussed. The business rules for statistical classifications (exhaustive and mutually exclusive) are not clear enough to support this divide, as the variants of Statistical Classifications do not always follow these rules and the Code Lists quite often do. In practice, it is often difficult to differentiate between Statistical Classifications and Code Lists, whereas tagging statistical classifications standard versions among Code Lists is straightforward.
