1.1 Employment rate for the age group 55-59
### Defini\si\n
Employed persons are those who are aged 15 year and over (16 and over in ES, IT, UK; 15-74 years in DK, EE, HU, LV, FI and SE) and who fall under one of the following categories:

- who during the reference week performed work, even for just one hour a week, for pay, profit or family gain;
- who were not at work but had a job or business from which they were temporarily absent because of, e.g., illness, holidays, industrial dispute or education and training.

Pay includes cash payments or “payment in kind”, whether payment was received in the week the work was done or not.

### Goal (rationale)
To capture employment activities of workers at a late stage of their careers.

### Survey question
Did you do any paid work in the 7 days ending Sunday the [date], either as an employee or as self-employed?

1. Yes
2. No

Even though you were not doing paid work, did you have a job or business that you were away from in the week ending Sunday the [date] (and that you expect to return to)?

1. Yes
2. No
3. Waiting to take up a new job/business already obtained

### Source
European Union (EU) Labour Force Survey (EU-LFS)

### Year

### Notes
The rationale for choosing employment rate over economic activity is that employment activity (and not being available to undertake employment) is important in measuring the experiences for active ageing. Also, in many countries, workers in the age group 55+ are so discouraged that they do not even search for job, and thus categorised as inactive.

One limitation of the indicator is that it makes no distinction between part-time and full-time workers. Thus, the indicator provides the level participation not employment intensity.

Another limitation of the indicator is that it may underestimate the activity potential of older persons in countries with (temporally) high old-age unemployment.

### 1.2 Employment rate for the age group 60-64

Definition: Definition of employed persons the same as for indicator 1.1

Goal (rationale): To capture employment activities of older workers at a late stage of their careers, especially during the ages when a good majority of workers in the EU countries exit the labour market for retirement

Survey question: Same as for indicator 1.1

Source: EU Labour Force Survey (EU-LFS)

Notes: Same as for indicator 1.1

Comparability: Same as for indicator 1.1.
1.3 Employment rate for the age group 65-69
