

Barriers

Please rate the following issues as barriers to successfully using data integration for the ongoing production of statistics

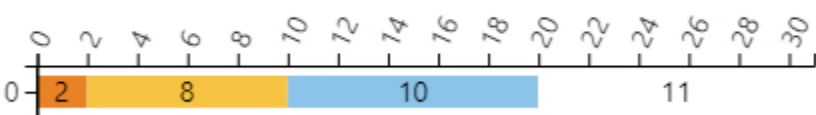

Not a barrier Slight Moderate Significant

Lack of supporting legislation or legislation that blocks data

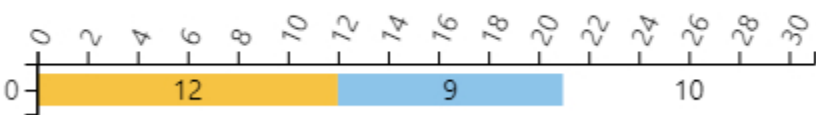

Access to new data sources

Access to data sources (e.g. when data provider changes availability)

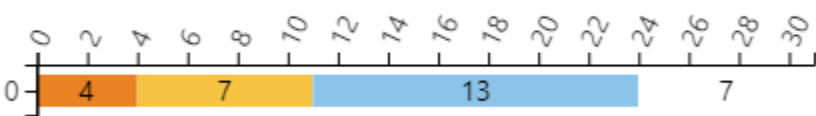

Quality issues

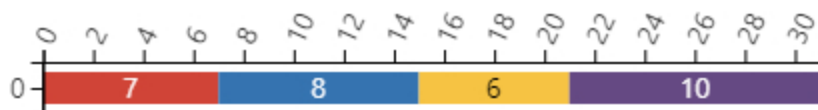

ICT issues

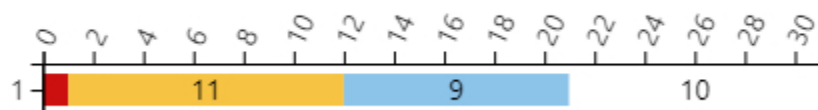

Lack of methodologies

information describing definitions, statistical units, etc in data

Differing definitions

Budget/Resources

Skills

Please describe any other barriers not mentioned above and/or provide links

Please describe any other barriers not mentioned above and/or provide links

Concerning item 3 Barriers we had different understanding of the question - to rate the issues as barriers in relation to the ongoing production of statistics in our organization (understanding 1) or rate the significance of the issues as barriers in general and not in relation to the existing ongoing production of statistics in our organization (understanding 2). In the response we rated the issues as barriers in relation to the ongoing production of statistics in our organization (understanding 1).

Lack of knowledge about the administrative files or data bases existing in the government

The barriers can be different to different kind of data sources. In case of Hungary, for example, the barriers are challenges are not that significant due to the established legal background and experience. In case of access to privately hold data for example, the barriers are much more significant.

Some barriers, however, are generic and not really data source specific. Such as: lack of metadata or quality issues.
