

Issue 13: Survey and frame populations

From GSIM v1.0 Glossary

Survey Population

A *Population* for which information can be obtained in a survey.

A *Population* which can realistically be studied (example: people currently residing in the province of Ontario not in an institution nor in a remote northern location nor temporarily out of the province). The *Survey Population* is therefore often a subset of the *Target Population*

Synonyms: object class

Frame population

A *Population* represented by records in a frame, which is the observable part of a *Target Population* and provides a reasonable approximation to it.

Example: most recent population census frame

Synonyms: object class
